Question: Prove that  $\forall L \in NP, L \leq_p \text{HALT}$

Proof:

Consider the language 3SAT.

Consider a non-deterministic turing machine  $M'$ .

Given an expression  $x$ , reduce  $x$  to  $\langle M, x \rangle$  where  $M$  is a machine that runs  $M'$  on  $x$  in all the possible ways and halts if  $M'$  accepts in at least one of these computations.

If  $x \in 3\text{SAT} \Rightarrow \exists$  an assignment for which  $x$  evaluates to T. so  $M'$  accepts one of the assignments which means that  $M$  halts.

If  $M$  halts on  $x \Rightarrow$  certain assignment was accepted by  $M'$ . so  $\exists$  an assignment for which  $x$  is true.

Since  $M$  is of constant size, the pairing  $\langle M, x \rangle$  can be done in polynomial time.

Hence,  $3\text{SAT} \leq_p \text{HALT}$

We know that 3sat is NP –complete,

$\Rightarrow \forall L \in NP, L \leq_p 3\text{sat}$  and  $3\text{SAT} \leq_p \text{HALT}$

Hence, that  $\forall L \in NP, L \leq_p \text{HALT}$
