## CE 601 NUMERICAL METHODS

## TUTORIAL - 6

Marks - 60
Date: 13-September-2012

The due date of responses to the tutorial questions is atleast by 9:00 am on 24-September-2012 (Monday). You can use computational programs like Matlab, Mathematica, Fortran, C, C++, etc. or any other convenient programming language (maybe even MS-Excel) to evaluate operations like additions, multiplications, matrix operations, etc.

1. For the polynomial $P_{3}(x)=x^{3}-9 x^{2}+26 x+24$, a) calculate $P_{3}(2.2)$ using nested multiplication, b) obtain deflated polynomial $Q_{2}(x)$ using synthetic division by factoring out $(x-2.5)$ from $P_{3}(x)$.
[10 marks]
2. Use the method of direct-fit polynomial for the following data set to approximate the function between time $t$ and distance $x$.

| Time, $t(\mathrm{~s})$ | 1.0 | 2.0 | 3.0 | 4.0 |
| :--- | :--- | :--- | :--- | :--- |
| Distance, $x(\mathrm{~m})$ | 4.5 | 23.0 | 80.5 | 213.0 |

3. Use Lagrange's third degree polynomial approximation for the given data set and interpolate the function value at $x=1.115$ using four decimal digit precision.

| $x$ | 0.4 | 0.6 | 0.8 | 1.0 | 1.2 | 1.4 | 1.6 | 1.8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $f(x)$ | 5.1600 | 3.6933 | 3.1400 | 3.0000 | 3.1067 | 3.3886 | 3.8100 | 4.3511 |

4. The following table gives the viscosity (in milli-Pascal-seconds) of sulphuric acid as a function of concentration (in grams per grams). Form the divided difference table and develop a quadratic polynomial approximation for the data. Interpolate the function to evaluate the viscosity at 0.52 concentration of sulphuric acid.

| Concentration | 0.0 | 0.20 | 0.40 | 0.60 | 0.80 | 1.00 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Viscosity | 0.89 | 1.40 | 2.51 | 5.37 | 17.4 | 24.2 |

[10 marks]
5. Use Newton's forward difference method to obtain a third degree polynomial approximation to the given data set and interpolate the temperature at 6.3 MPa pressure:

| Pressure (MPa) | 4.0 | 5.0 | 6.0 | 7.0 | 8.0 | 9.0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Temperature ( ${ }^{0} \mathrm{C}$ ) | 250.40 | 263.99 | 275.64 | 285.88 | 295.06 | 303.40 |

6. The experimental data on partial pressure of water vapor $p_{A}$ (in atm) with respect to the distance $y(\mathrm{~mm})$ from the surface of a pan of water is given below. Estimate a) the partial pressure at $y=1.5 \mathrm{~mm}$ and b ) the distance $y$, when the partial pressure $p_{A}=$ 0.026 .

| $y(\mathrm{~mm})$ | 0.0 | 1.0 | 2.0 | 3.0 | 4.0 | 5.0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $p_{A}(\mathrm{~atm})$ | 0.100 | 0.065 | 0.042 | 0.029 | 0.022 | 0.020 |

[10 marks]
