

Tutorial II

Classical Mechanics

Course: PH211 + PH403

Jul-Nov. 2010

1. Find the degree of freedom of a carbon-dioxide molecule ($\text{O}=\text{C}=\text{O}$) moving in 3-dimensions under each of the following “models” .
 - (a) The $\text{C}=\text{O}$ bonds are rigid, and $\angle\text{O}-\text{C}-\text{O}$ is rigid and is equal to 180° .
 - (b) The $\text{C}=\text{O}$ bonds are harmonic (flexible), but $\angle\text{O}-\text{C}-\text{O}$ is rigid and is equal to 180° .
 - (c) The $\text{C}=\text{O}$ bonds are rigid, but $\angle\text{O}-\text{C}-\text{O}$ is flexible.
 - (d) The $\text{C}=\text{O}$ bonds and $\angle\text{O}-\text{C}-\text{O}$ are flexible.
2. Find the number of degree's of freedom of a CH_4 molecule according to the following models,
 - (a) All $\text{C}-\text{H}$ bonds and all $\text{H}-\text{C}-\text{H}$ angles ($\angle\text{H}-\text{C}-\text{H}$) are stiff
 - (b) All $\text{C}-\text{H}$ bonds are harmonic but all $\angle\text{H}-\text{C}-\text{H}$ are stiff
 - (c) All $\text{C}-\text{H}$ bonds are stiff but all $\angle\text{H}-\text{C}-\text{H}$ vary
 - (d) All $\text{C}-\text{H}$ bonds and all $\angle\text{H}-\text{C}-\text{H}$ are harmonic
3. Use the D'Alembert's principle of virtual work to obtain the equation of motion of the following 2-D systems:
 - (a) a simple pendulum.
 - (b) a particle moving in a parabolic ($y = ax^2$) wire under gravity.
 - (c) a particle sliding down a wedge of angle α .
